11. (Original) A wound film dispenser, comprising:

a base;

a cover hinged to the base;

a roll of wound film within the base; and

means for retaining the roll within the base, the means including false walls angularly biased into the base.

12. (Original) The wound film dispenser of claim 11, wherein each false wall includes an aperture at least partially surrounding an end of the roll of wound film.

13. (Original) The wound film dispenser of claim 11, wherein each false wall includes a flap extending from the false wall toward an end of the base.
14. (Original) The wound film dispenser of claim 13, wherein each flap extends from a back edge of one of the false walls.
15. (Original) The wound film dispenser of claim 14, wherein each flap extends from a top edge of one of the false walls.
16. (Original) The wound film dispenser of claim 12, wherein each aperture is semi-circular in shape.
17. (Original) The wound film dispenser of claim 11, wherein the base, cover, and means for retaining are manufactured from a unitary piece of material.
18. (Original) The wound film dispenser of claim 17, wherein the material is die-cut single ply chipboard.

19. (Original) A method of assembling a wound film dispenser, comprising the steps of:

folding a blank into a tube, the tube having first and second open ends, a top surface, a bottom surface, a front surface, and a back surface;

inserting a roll of wound film through one of the open ends of the tube;

folding false walls into the tube, the false walls including apertures receiving ends of the roll; and

folding at least one flap against each of the false walls, the false walls including braces engaging the flaps and biasing the false walls angularly into the tube.

20. (Original) The method of claim 19, further including the step of folding a second flap against each of the flaps.

21. (Original) The method of claim 19, further including the step of folding each brace relative to one of the false walls.

22. (Original) The method of claim 21, wherein the brace is folded relative to a back edge of the false wall.

23. (Original) The method of claim 21, wherein the brace is folded relative to a top edge of the false wall.

24. (Original) The method of claim 21, further including the step of adhering a tear strip of the blank to the front surface of the blank to form the tube.

25. (Original) The method of claim 24, wherein the tear strip is attached to the blank along a score line, and adhered to the front surface at discrete areas of adhesive.
